

Why is Whooping Cough on the Rise, and What Can You Do About It?

Date:

Nov 2012

[Visit Article](#)

An old disease is back. Cases of pertussis, or whooping cough, have more than tripled in the past five years, with 2012 on track to be the most severe in over a half-century. More than 37,000 cases have been reported so far – 37 times the number in 1976, which was the lowest since the introduction of vaccines dramatically reduced prevalence of the disease.
